Aalto University, Espoo, Finland

ABSTRACT

This paper studies the following aspects fo federated learning ...

Index Terms— Federated Learning, Networks, Personalized Machine Learning, Trustworthy AI

1. INTRODUCTION

- Explain the background (real-life scenario) of your ML application (see [1, Ch. 2]).

- Summarize the relevant literature (state-of-the art).

- Briefly outline the structure of this paper.

2. PROBLEM FORMULATION

- Formalise your application an a FL problem along the lines of the lecture notes ("A Design Principle for FL").

- Provide a precise definition (choice for) the local datasets, their data points, features and labels of this FL problem.

- Explain the source of the data.

3. METHODS

- Clearly state the number of datapoints in each local dataset.

- Mention any specific characteristics of data and clearly state if any data preprocessing has been implemented.

- Explain your feature selection process (no theoretical justification needed).

- Describe and explain (why?) your choice of networked model(s)/hypothesis space(s), e.g., linear predictors, etc.

- Describe and explain which FL algorithm you have used to train the networked model (see Section "FL Algorithms" of lecture notes)

- Describe and explain (why?) your choice of loss function(s), e.g., logistic loss

- Explain the process of model validation - how did you split the data into training, validation and test sets. What are the sizes of each set and why did you make such design choice.

4. RESULTS

- Compare and discuss the training and validation errors.

- Which is the final chosen method and why?

- What is the test error of the final chosen method?

5. CONCLUSION

- Provide a succinct summary of your findings.

- Are the results suggesting that the problem is solved satisfactorily, or might there be room for improvement?

- Ponder about possible limitation of the methods and how it can be further improved.
